“Zelbrite active filter media is considerate to the environment.

It will last twice the life of sand.”

## Better Filtration

Make your pool safer with Zelbrite. Reduce exposure to Giardia and Cryptosporidium.

Tests conducted by the Australian Water Quality Centre prove that ZELBRITE FILTER MEDIA will out filter sand, DE and glass.

Did you know that using ZELBRITE FILTER MEDIA will help keep your pool free from an outbreak of Giardia or Cryptosporidium?

## Saves Water

Zelbrite is crushed volcanic rock and has a far greater surface than sand.

We can safely say that you will double the time between backwashes and when you do have to backwash it will only take half the time to do it.

## Saves Chemicals

The better the filtration the less chemicals are required to keep your pool safe and healthy.

## Saves Heating

Because you backwash less often there is less top up water to be heated.

## What is Zelbrite?

Zelbrite active filter media is made from the unique natural mineral called Zeolite.

This environmentally friendly mineral has a 3-dimensional structure of microscopic apertures and channel-ways like a hard, but porous sponge.

Zelbrite's porous structure provides a huge surface area which traps the smallest particles, down to 2 microns.
